

May 1, 2022

Cleave Simpson, General Manager
Rio Grande Water Conservation District
8805 Independence Way
Alamosa, CO 81101

**RE: 2022 ANNUAL REPLACEMENT PLAN APPROVAL: SPECIAL
IMPROVEMENT SUBDISTRICT NO. 6 OF THE RIO GRANDE
WATER CONSERVATION DISTRICT**

Dear Mr. Simpson:

Thank you for your April 15, 2022 submission of the Special Improvement District No. 6's proposed Annual Replacement Plan (ARP) for the 2022 Plan Year (**May 1, 2022 through April 30, 2023**).

My staff and I have reviewed the proposed ARP and its appendices. A copy of this approval will be posted on the DWR website by next week at:

<https://dwr.colorado.gov/division-offices/division-3-office>

All information and data related to this approved ARP are available on our website.

Enclosed, please find my approval of the 2022 ARP.

Kevin Rein, P.E.
State Engineer
Director of Division of Water Resources

cc: Division 3

Subdistrict No. 6 ARP Approval: Plan Year 2022

Review, Findings, and Approval of Subdistrict No. 6's 2022 Annual Replacement Plan

Background

Special Improvement District No. 6 (“Subdistrict”), a political subdistrict of the Rio Grande Water Conservation District (“RGWCD”), formed through Conejos County District Court in Case 2018CV30014, timely submitted its proposed Annual Replacement Plan (“ARP”) pursuant to its Plan of Water Management (“PWM”) approved by the State Engineer and noticed through Division No. 3 Water Court in Case No. 2019CW3011 on September 25, 2019.

The 2022 Plan Year ARP and its appendices were available for download through a link on the RGWCD website. The ARP, its appendices, and resolutions were provided to the State and Division Engineers on April 15, 2022. Copies of the ARP were made available for viewing at the State and Division Engineers’ offices. The ARP, its appendices, resolutions, the Subdistrict’s Response Functions, and this letter are posted on DWR’s website. My staff and I have conducted this review of the ARP and comments thereon in accordance with the operational timelines specified in the Rules Governing the Withdrawal of Groundwater in Water Division No. 3 (the Rio Grande Basin) and Establishing Criteria for the Beginning and End of the Irrigation Season in Water Division No. 3 for all Irrigation Water Rights (“Rules”), Case 2015CW3024. The Rules were approved as promulgated and were deemed effective as of March 15, 2019 by the Division No. 3 Water Court.

DWR Review

As set forth in the Rules, I must determine whether the ARP presents “sufficient evidence and engineering analysis to predict where and when Stream Depletions will occur and how the Subdistrict will replace or Remedy Injurious Stream Depletions to avoid injury to senior surface water rights.” (Rules 11.3). Also, The ARP will include: a database of Subdistrict and Contract Wells that will be covered by the ARP; a projection of the groundwater withdrawals from Subdistrict and Contract Wells during the current Water Administration Year; a calculation of the projected stream depletions resulting from groundwater withdrawals from Subdistrict and Contract Wells; a forecast of the flows for Division No. 3 streams; detailed information regarding the methods that will be utilized to replace or remedy injurious stream depletions during the ARP Year, including any contractual agreements used for replacement or remedy of injurious stream depletions that will be in place; any information regarding the fallowing of Subdistrict Lands; information to document progress towards achieving and maintaining a Sustainable Water Supply; and, documentation that sufficient funds are or will be available to carry out the operation of the ARP.” (Subdistrict PWM, Section 6.1.2). Finally, I must review the ARP pursuant to the statutory mandates, constitutional requirements, rules and regulations adopted in Division No. 3, and any letters, comments, or other objections submitted by water users regarding the adequacy of the ARP.

Subdistrict No. 6 ARP Approval: Plan Year 2022

With the foregoing in mind, I turn to a review of the ARP. It would be unwieldy to include in my review every detail of the thorough ARP, so for the purpose of this letter, I incorporate it and its supplements by reference. There were no letters, comments, or other objections submitted regarding the 2022 ARP.

11.1.1 Database of All Wells to be Covered by the ARP

Structure Identification Number (WDID) (Section 1 of 11.1.1 of the ARP)

A comprehensive list of wells included in the ARP is necessary in order to allow DWR to verify which wells are authorized to operate in accordance with the ARP. To that end, the Subdistrict submitted the most current tabulation of the structure identification number (WDID) of each well included in the Subdistrict (see Appendix A of the ARP). The Subdistrict also supplied a spreadsheet to DWR of the list of Subdistrict Wells as a supplement to the 2022 ARP. Appendix A lists 532 wells, which includes 8 wells included by contract for 2022.

The contract wells accepted by the Subdistrict in 2022 are listed in Appendix B. Contract wells were reviewed for the terms of the contracts, associated permits and decrees for each well, and historical meter records. Any wells that are not used within the permitted and/or decreed beneficial uses authorized for those structures cannot be covered by the 2022 ARP and the owners will be notified by separate correspondence.

Wells that have submitted an SWSP and/or started the process of changing an existing permitted/decreed use to a Non-Exempt use described in the participation contract can be conditionally accepted. These wells cannot be operated until the SWSP and/or decree is finalized and approved. Should an SWSP become invalid during the ARP Year or the change of use in a court case be denied, the well can no longer be covered by the ARP and the owners will be notified.

All wells accepted as contract wells for this ARP approval have permitted and/or decreed limits, and they will only be accepted for groundwater withdrawals up to those respective limits. If historical records indicate a pattern of exceedance of these limits in the past, owners of these wells may be notified by separate correspondence that their wells are being conditionally accepted, and that exceedance of the legal limits will not be covered under this ARP. The Subdistrict will be copied on all separate correspondence sent for these purposes.

Other Well Identification Information (Section 2 of 11.1.1 of the ARP)

The database of wells the Subdistrict has accepted as part of this ARP was satisfied under 11.1.1.1.

Subdistrict No. 6 ARP Approval: Plan Year 2022

Subdistrict Wells with Plans for Augmentation (Section 3 of 11.1.1 of the ARP)

The ARP Well List includes some wells that are either fully or partially augmented by an approved plan for augmentation which is administered separately of the Subdistrict’s PWM. These plans for augmentation associate surface rights with these Subdistrict Wells and other non-Subdistrict wells to remedy some portion or all of each well’s injurious stream depletions. These wells are included in the Subdistrict’s ARP Well List, and if any portion of their legally decreed groundwater withdrawals is not remedied by an individual plan for augmentation, it is subject to Subdistrict fees and the Subdistrict will remedy injurious stream depletions and post-plan injurious stream depletions attributable to the non-augmented portion of a well’s total groundwater withdrawals as part of this ARP. “The Subdistrict and this Plan of Water Management or ARP cannot be used as a source of water for new or expanded consumptive use of groundwater which is not within the terms and conditions of a valid permit or decree which was in effect as of October 4, 2018, or for new or expanded plans for augmentation or other replacement plans without the approval of both the Court and the Subdistrict’s Board of Managers.” (PWM at 2.4.6)

San Luis Valley Water Conservancy District Augmentation Certificate No. 773

The ARP lists one well as a Subdistrict Well that is fully augmented for the existing uses through the SLVWCD. This well, WDID 2014260, Permit 77196-F was permitted and drilled under SLVWCD’s augmentation plans as an expansion of use of Subdistrict Well WDID 2014260, Permit 45498-F. The Subdistrict retains this well on the well list as a non-benefitted well.

I have reviewed Appendix A, Appendix B, and Appendix C of the ARP and consulted with staff and, find it to be an accurate inventory of Subdistrict Wells that meets the requirements of Rule 11.1.1.

Total Combined Projected Annual Diversion for All Subdistrict Wells (Section 4 of 11.1.1 of the ARP)

For Subdistrict ARP Wells listed in this ARP, DWR total metered groundwater withdrawals as of April 1, 2022 for the 2021 Water Administration Year were 101,800 acre-feet. Comparing to 2021 and considering operational changes from Subdistrict members for 2022, the Subdistrict ARP Well groundwater withdrawals in 2022 are projected to be **96,000 acre-feet**.

Subdistrict Well Metered Pumping (acre-feet)
Entered in Table 2.1 of the ARP

2011	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021
118,020	113,302	111,231	93,633	86,595	83,089	75,436	116,049	70,219	106,308	101,800

The majority of metered groundwater withdrawals in the Plan Year will be used for irrigation through center pivot sprinklers, 71 percent. Approximately 5 percent of groundwater withdrawals will be applied to flood irrigation and 24 percent to other uses.

Subdistrict No. 6 ARP Approval: Plan Year 2022

Expected Methods of Irrigation, the Combined Projected Number of Acres Irrigated and the Total Projected Acreage by Each Irrigation Method (Section 5 of 11.1.1 of the ARP)

Subdistrict ARP wells are projected to irrigate approximately 60,000 acres during the Plan Year, including 47,200 acres irrigated by center pivot sprinklers and 12,800 acres irrigated by flood application. The Subdistrict made this projection based on review of the breakdown of acres in the RGWCD's annual Irrigated Ag Census and information submitted with Participation or Inclusion Contracts.

Non-Irrigation Subdistrict Wells - Calculation of All Projected Withdrawals and Projected Net Groundwater Consumptive Use (Section 6 of 11.1.1 of the ARP)

Included in the ARP Well List are a number of wells with beneficial uses other than irrigation. The Subdistrict utilized information provided by DWR to calculate the consumptive use rates used in the RGDSS Model to calculate stream impacts and returns. Beneficial uses include municipal, domestic, commercial, industrial, and aquaculture. A spreadsheet was prepared by the Subdistrict to calculate the composite Consumptive Use Ratio that is a necessary input in the Response Functions. A spreadsheet of the calculation prepared for use in the 2022 ARP was submitted as supplement to this ARP.

Other Data Necessary to Support the Projected Stream Depletions (Section 7 of 11.1.1 of the ARP)

No other data was provided.

Other Information Required by the State and Division Engineers and Reasonably Necessary to Evaluate the Proposed ARP (Section 8 of 11.1.1 of the ARP)

The supplemental information needed to evaluate the 2021 ARP and provided to the State Engineer included:

1. An electronic copy of the Response Functions used to prepare the tables included in this ARP.
2. The list of Subdistrict Wells included in the 2022 ARP in spreadsheet format matching the list presented in Appendix A
3. Spreadsheet showing the Subdistrict's breakdown of "Other" wells used to calculate the composite Consumptive Use Ratio in the Response Function.
4. Resolution from RGWCD approving the Subdistrict 2022 ARP.
5. Resolution from RGWCD to allow the Subdistrict to allocate Closed Basin Project water in the 2022 ARP.
6. A Forbearance Yield Analysis. This is a description of the Subdistrict's approach to estimate the probable yield of replacement sources for the various forbearance contracts with ditches under forbearance agreements. A copy of the spreadsheet used in the analysis was provided as supplement to the ARP.

Subdistrict No. 6 ARP Approval: Plan Year 2022

7. Operational Requests to the Division Engineer for the 2022 ARP
- The Subdistrict requests to aggregate depletions between Stream Reaches as part of the anticipated operation in 2022.
 - The Subdistrict requests to aggregate depletions with other Subdistricts during the 2022 ARP year.
 - The Subdistrict requests the Division Engineer allow a portion of the Closed Basin Project (CBP) production that is generated during the irrigation season be used to offset the Subdistrict’s non-irrigation season depletions, though not to exceed the allocation approved by the CBP Operating Committee. This becomes necessary when the depletions owed for all RGWCD Subdistricts combined in any one or more months during the non-irrigation season are greater than the production of the Closed Basin Project production in those months.

11.1.2 Projected Stream Depletions from the Wells Covered by the ARP based on the Applicable Response Function or Approved Alternative Method

Section 2 of the ARP presents the data utilized to project stream depletions to the Conejos River, Alamosa River, and Rio Grande as a result of the Plan Year’s groundwater withdrawals from Subdistrict ARP Wells. The Response Function outputs identify total projected stream depletions for the Plan Year, a breakdown of the monthly stream depletions for the Alamosa, two reaches on the Conejos, and three reaches on the Rio Grande, and a projection of the Post-Plan Stream Depletions calculated as a result of the predicted Plan Year groundwater withdrawals from Subdistrict ARP Wells. The Subdistrict used the current 6P98 Response Functions to calculate projected stream depletions for this ARP.

The April through September streamflow forecasts included in the ARP are made by the Division Engineer and are based upon guidance given by forecasts from the United States Department of Agriculture’s Natural Resources Conservation Service (“NRCS”), the National Weather Service NWS), and the National Center for Atmospheric Research (NCAR) (Appendix C of the ARP). The annual streamflow forecasts included in the ARP for the Rio Grande and Conejos River basins are those included in the March 31, 2022 Division Engineer’s Rio Grande Compact Ten Day Report (Appendix C of the ARP).

The NRCS streamflow statistics are calculated over a 30-year period and updated each decade, in agreement with World Meteorological Organization (WMO) standards. This 30-year reference period was chosen to characterize the current hydro climatology at each station. The most recent medians and averages have been updated to include data for the water years 1991-2020. The current year streamflow projection is compared to the 30-year reference period to determine the percent of “normal” streamflow. The NRCS forecasts were reported as percent of the median in this report.

2022 Stream Flow Forecast - Conejos River (Section 1 of 11.1.2 of the ARP)

Subdistrict No. 6 ARP Approval: Plan Year 2022

The Subdistrict used the Division Engineer’s streamflow forecast and the data collected from the Division Engineer’s Rio Grande Compact Ten Day Report. This forecast was based upon the NRCS forecast (projected 50% exceedance streamflow at the Conejos River near Mogote, Los Pinos River near Ortiz, and San Antonio River at Ortiz gaging stations for the period April-September), the NWS forecast, and the NCAR forecast. There were some differences between the NRCS and the Division Engineer’s forecasts as shown in the following table. The April - September flow for the Conejos is **223,600 acre-feet** for use in the Response Functions for 2022.

Stream Flow Forecasts- Conejos River, Rio Grande, Alamosa River

Conejos Stream Flow Forecast	Apr-Sep Forecast (acre-feet)	% of median	Estimated Additional (acre-feet)	Jan - Dec Forecast (acre-feet)
Analysis	(1)	(2)	(3)	
NRCS, April 1st Forecast				
Conejos River near Mogote	161,000	96%		
Los Pinos River near Ortiz	48,000	87%		
San Antonio River at Ortiz	6,500	95%		
TOTAL	215,500			
Division Engineer, Ten Day, 3/31/2022				
Conejos River near Mogote	153,500	91%		
Los Pinos River near Ortiz	61,500	100%		
San Antonio River at Ortiz	8,600	90%		
TOTAL	223,600		26,400	250,000
Rio Grande Stream Flow Analysis				
NRCS, April 1st Forecast	365,000	71%		
Division Engineer, Ten Day, 3/31/2022	365,000	71%	75,000	450,000
Alamosa River Stream Flow Analysis				
NRCS, April 1st Forecast	57,000	93%		

- (1) projected 50% exceedance streamflow at the gaging station
- (2) NRCS 30-yr Average Flow: Conejos-168,000, Los Pinos-61,000, San Antonio-9,600, Rio Grande-480,000, Alamosa-61,000 (recently adjusted from Conejos-194,000, Los Pinos-73,000, San Antonio-15,600, Rio Grande-515,000, Alamosa-68,000)
- (3) January through March and October through December

Projected Plan Year Stream Depletions (Section 2 of 11.1.2 of the ARP)

Subdistrict staff predicted stream depletions caused by Subdistrict ARP Wells utilizing the Response Functions developed for the Alamosa La Jara Response Area under the RGDSS Groundwater Model Phase 6P98.

The Response Function spreadsheet was built to be used for the whole Response Area. Two instruction sheets were prepared by DWR for additional inputs to the Response Functions when there is a need to use it for individual or group of wells. The instruction sheet, “How to Use the Application Workbook for a Subset (individual/group) of Wells” (9/23/2015),

Subdistrict No. 6 ARP Approval: Plan Year 2022

describes how to adjust the spreadsheet inputs to stream reaches that have been modeled with point source returns to streams. The instruction sheet, “How to Adjust the Application Workbook for use with a Subset of Wells” (10/15/2015), describes how to use the “Ratio Method” for Response Areas where it is necessary to apply this method.

The first step in using the current 6P98 Response Function is to input data for the whole Response Area, i.e., historical groundwater withdrawals for sprinkler irrigation, flood irrigation, “Other” pumping with corresponding “Other” consumptive use ratios for the years 2011 through 2021 and predicted values for 2022.

The Subdistrict has elected to use the Response Function spreadsheet for the subset of wells represented by the Subdistrict ARP Wells. The Alamosa La Jara Response Area requires adjustments for both point source return flows and the stream ratios, as listed below.

- Alamosa La Jara Response Area - Reach 3 (Rio Grande from Del Norte to Excelsior Ditch) from the City of Monte Vista.
- Alamosa La Jara Response Area - Reach 5 (Rio Grande from Chicago to State Line) from the City of Alamosa.
- Alamosa La Jara: Reach 1 Calculations Ratio, and Reach 6 Calculations Ratio,

Using the whole Response Area results, adjustments are made on appropriate pages of the Response Function spreadsheet. The Subdistrict ARP Wells do include the Town of Monte Vista and the Town of Alamosa wells associated with the point source return flow. Adjustments for the Ratio Method must be made for Reach 1: Conejos above Seledonia/Garcia and Reach 6: Alamosa River.

Once these preliminary steps are completed, the next step in calculating stream depletions using the Response Functions is updating Table 2.1 to derive the annual net groundwater consumptive use. The consumptive use ratios for sprinkler and flood irrigation used in the Model are standard factors of 83% and 60%, respectively. The consumptive use ratio for “Other” wells is specific to the uses of those wells and can vary widely. The “Other Consumptive Use Ratio” for the whole Response Area is a composite derived from the individual well withdrawals and consumptive uses.

The Subdistrict provided a spreadsheet of “Other” wells included in the Subdistrict ARP Well list as a supplement to the ARP. The spreadsheet shows the individual well groundwater withdrawals and consumptive use factors to explain how the composite ratios were determined for the subset wells represented in Table 2.1 of the ARP.

Historical ARP Well groundwater withdrawal values were entered in Table 2.1 for years 2011 through 2021. No adjustments were made by the Subdistrict for groundwater withdrawals of the subset wells for any years prior to 2011. Projected ARP Well groundwater withdrawal values were used for 2022. The Subdistrict has no Recharge that Offsets Groundwater for calculation of the Net Groundwater Consumptive Use. The projected Net Groundwater Consumptive Use for the Plan Year is 71,860 acre-feet.

Subdistrict No. 6 ARP Approval: Plan Year 2022

Following determination of the Net Groundwater Consumptive Use, the data was incorporated in the Response Functions Table 2.2 to calculate stream depletions for the Plan Year and projected into the future.

The Response Functions calculated stream depletions to the Conejos River, Rio Grande, and Alamosa River during the Plan Year, due to both past ARP Well groundwater withdrawals and the projected Plan Year ARP Well groundwater withdrawals. The total depletions are **8,195.8 acre-feet**, which includes negative depletions of **501.6 acre-feet** on Stream Reach 3 of the Rio Grande. The Response Functions calculated total stream depletions to the Conejos River are **4,177.0 acre-feet**, to the Alamosa River **511.0 acre-feet**, and to the Rio Grande **3,507.8 acre-feet**. The locations of the stream depletions and monthly quantities are also tabulated in Table 2.3.

Post-Plan Stream Depletions are estimated to accrue to impacted streams for approximately 15 years. Based on predictions from the Response Functions, Table 2.4 of the ARP shows there would be a total of **26,170 acre-feet** of Post-Plan Stream Depletions. This amounts to **4,048 acre-feet** to the Conejos, **19,859 acre-feet** to the Rio Grande, and **2,264 acre-feet** to the Alamosa.

11.1.3 Description of How Injurious Stream Depletions from Groundwater Withdrawals by Wells Included in the ARP will be Replaced or Remedied

Amounts and Sources of Replacement Water for 2022 Plan Year (Section 1 of 11.1.3 of the ARP)

The Subdistrict has assembled a portfolio of water supplies for the replacement of Injurious Stream Depletions and remedies other than water. The ARP identifies the water rights, their availability and their amounts in Table 3.1 of the ARP. Applications for renewal of several SWSPs have been submitted and applications for several new SWSPs have been submitted or the Subdistrict has plans to submit them. Upon approval, these sources can be added for use under the 2022 ARP.

The adequacy of replacement sources for the ARP Year are dependent upon contracted amounts the Subdistrict has acquired as well as the availability of the source to pay depletions in place and time. For purposes of review of adequacy of replacement sources, there are three categories defined below, with examples described for each.

In Storage: Reservoir water in storage under the control of the Subdistrict. This water is available for release at the direction of the Subdistrict.

In Season: Ditch water that will become available to the Subdistrict when in priority during the irrigation season in the amount of depletion owed to streams daily by the Subdistrict. For some sources, water not used to pay daily depletions may be stored for Subdistrict use later.

Subdistrict No. 6 ARP Approval: Plan Year 2022

On Call: Remedies, such as forbearance, that are available in the amount of depletion owed to streams daily by the Subdistrict, limited to when the forbearance ditch is the calling water right. I note that forbearance depends on climate and actual days when a ditch is the calling water right and the exact yield per year is indeterminate. It is also noted that the amount of forbearance water usable by the Subdistrict is limited by their depletions owed daily to streams. In addition, several Subdistricts are seeking forbearance agreements with the same ditches. DWR considers these potential competing agreements when evaluating forbearance as a replacement source.

This replacement water or remedy will be available to replace Injurious Stream Depletions as directed by the Division Engineer. A summary of the portfolio items is shown in the Replacement Sources tables on the following pages. I will approve up to the full amount itemized in the Replacement Sources tables and stated in the following sections for use in the 2022 ARP.

Subdistrict No. 6 Replacement Sources Conejos River (acre-feet)

	Water Right Name	Submitted in ARP	Approved in SWSP's	Remaining 5/1/2022 & Approved for 2022 ARP

Note: * DWR Analysis

After Acquired Sources of Remedy (Section 2 of 11.1.3 of the ARP)

DWR recognizes the Subdistrict will continue to work to acquire additional sources of remedy and may, with approval from the Division Engineer, use those sources to remedy injury under this ARP.

Operation of the 2022 Annual Replacement Plan (Section 3 of 11.1.3 of the ARP)

The ARP states that the Subdistrict’s replacement water will be released, including transit losses, from Platoro Reservoir, located in the Upper Conejos; Terrace Reservoir, located on the Alamosa River; and Rio Grande, Santa Maria, Continental, and Beaver Park Reservoirs, located in the Upper Rio Grande, at the direction of the Division 3 Engineer, to offset injurious stream depletions on the respective rivers during the Plan Year. This applies to the “In-Storage” water identified in the Replacement Sources tables on the previous pages. All Plan Year injurious stream depletions will be replaced in the time, location and amount that they occur, beginning May 1, 2022. The reaches, amounts and time that stream depletions are projected to occur are shown in Table 2.3 in the ARP. These releases of water from storage will be performed under the provisions contained in section 37-87-103, C.R.S.

The ARP notes that Sections 37-80-120, 37-83-104, and 37-83-106, C.R.S., allow for exchanges to occur between reservoirs without a decree and if recognized by the Division Engineer. Appropriate accounting between the Division Engineer’s Office and Subdistrict No. 6 will occur on a regular and routine basis if these exchanges do occur. Any reservoir exchanges done in the Plan Year will be documented and reported in the 2022 Annual Report. The Division Engineer’s Office will be notified in advance of any reservoir exchanges, and the exchanges must be documented and approved prior to them occurring.

The ARP provided an agreement with San Luis Valley Irrigation Well Owners, Inc. to lease up to 2,000 acre-feet for Subdistrict No. 3, up to 3,000 acre-feet for Subdistrict No. 6 and up to 3,000 acre-feet for Trinchera Subdistrict of water and/or consumptive use credits from the water rights that are subject to the 2015CW3030 case. SLVIWO and Trinchera Subdistrict submitted separate SWSP requests for the use of this water. The SWSP approval allows these credits to be used on the day the credits are generated for replacement of daily injurious stream depletions in Rio Grande Stream Reach 3 and/or Conejos Stream Reach 2; and/or replacement of daily injurious stream depletions by exchange to other stream reaches

Subdistrict No. 6 ARP Approval: Plan Year 2022

defined in the RGDSS; and/or by exchange to a reservoir. Credits may be delivered to a Compact 'Depletion Bank' where they can be used for remedy of depletions owed to Rio Grande Stream Reach 3 during the irrigation and non-irrigation seasons. This water may be used to remedy depletions for other stream reaches when conditions permit, as further outlined in the SWSP.

In 2020, the Subdistrict made an agreement with the Bureau of Land Management to lease up to 900 acre-feet of Excess Credits as defined in the 2002CW38A decree for use in the ARP. SWSP 6163 allowed storage of the Subdistrict's Excess Credits in Platoro Reservoir as shown in the table of replacement sources and this water can be released as needed. A new SWSP request was submitted 4/5/2022. This replacement water must be used during the irrigation season unless there are no restrictions due to Article 7.

The ARP provides documentation that the Subdistrict has implemented Forbearance Agreements with a number of ditches located on the Conejos River, the San Antonio River, the Los Pinos River, the Alamosa River, and the Rio Grande for the Plan Year. At times when the Conejos, the San Antonio and the Los Pinos are connected, the calling right can be on the San Antonio or the Los Pinos. The majority of the forbearance agreements allow the Subdistrict to exercise these agreements in its sole discretion.

The ARP provides an agreement with the Centennial Ditch in the Appendix. The resolution suggests an alternative for circumstances when replacement water needs to be carried below the Excelsior Ditch, but when the Rio Grande can be dry below the headgate. Instead, replacement water will be carried around that dry reach through the Centennial Ditch. The water will be measured and delivered directly to the Rio Grande at the point the Centennial Ditch can return water directly to the Rio Grande. That point is above any water right that may be injured while in priority. The Centennial Ditch must be adequate to efficiently deliver water around the dry stretch of river to the satisfaction of the Division Engineer prior to this being considered a viable option. The Centennial Ditch Company's water rights are senior enough to accomplish this carriage in any foreseeable situation (Priority Nos. 32 and 173).

The Response Functions did not predict stream depletions to streams other than the Conejos River, Alamosa River, and the Rio Grande in amounts above the minimum threshold to reliably predict impacts. Therefore, no replacements to any stream other than the Conejos, Alamosa, and Rio Grande will be made.

The ARP indicates that at times when there is no requirement to deliver water to the Lobatos Gage to meet the requirements of the Rio Grande Compact, no water will be delivered to the lower reach of the Rio Grande for replacement of Injurious Stream Depletions to the Rio Grande Compact from the Subdistrict. The only instances where the Subdistrict is not required to replace these Stream Depletions are when there is an excess of 150,000 acre-feet of credit for Colorado or Elephant Butte Reservoir has spilled. In these instances, water passing the Lobatos Gage will not result in Compact credit to Colorado. In all other circumstances, the replacement of Injurious Stream Depletions to the Rio Grande Compact will result in credit being given to Colorado, either for the current year or for

Subdistrict No. 6 ARP Approval: Plan Year 2022

future years. DWR agrees that the Subdistrict may replace these Injurious Stream Depletions after the irrigation season or when Compact deliveries are being made.

The Rules require remedies sufficient to also remedy total Post-Plan Stream Depletions caused by current and past years' ARP Wells groundwater withdrawals that deplete the streams after the term of this ARP. Section 4.1.5 of the Subdistrict's PWM includes the provision, "the Subdistrict may continue to assess fees until all Post-Plan Injurious Stream Depletions caused by past groundwater withdrawals from Subdistrict Wells have been remedied." This allows the Subdistrict to provide a financial guarantee to assure that all Post-Plan Injurious Stream Depletions will be replaced or otherwise remedied if the Subdistrict were to fail or otherwise not be allowed to continue groundwater withdrawals.

If the Subdistrict were to fail, the individual well owners in the Subdistrict would have to obtain plans for augmentation or take other measures to comply with the Rules. Presumably, those plans would be required to replace Post-Plan Injurious Stream Depletions into the future. In the interim, the Subdistrict or the Rio Grande Water Conservation District will remedy Post-Plan Injurious Stream Depletions by supplying water or through agreements pursuant to which injury to water rights is remedied by means other than providing water to replace stream depletions.

Anticipated Funding for Plan Year (Section 4 of 11.1.3 of the ARP)

The Subdistrict submitted sufficient financial information to document the purchase and leases of replacement water for the 2022 Plan Year.

11.1.4 Contractual Arrangements among Water Users, Water User Associations, Water Conservancy Districts, Subdistricts, and/or the Rio Grande Water Conservation District

San Luis Valley Irrigation Well Owner's, Inc. (SLVIWO) - Case No. 2015CW3030 (Section 1 of 11.1.4 of the ARP)

On December 30, 2015, the SLVIWO filed an Application for Recharge Project and Rights of Substitution and Exchange. The SLVIWO is the owner of the water right and corresponding structures associated with the Taos Valley Canal No. 3. The original decree for the water rights decreed to the Taos Valley Canal No. 3 is the Decree of the Court entered in the Matter of the Adjudication of the Priority of Water Rights in the Conejos and San Antonio Rivers (Water District No. 88), District Court, Conejos County, Colorado (October 3, 1890). In 1975, SLVIWO filed an application for a plan for augmentation including exchange and to change the place and type of use of the Taos Valley No. 3 water right in Case No. W-3394 to include augmentation of any depletions caused by well users of the SLVIWO. The Taos Valley No. 3 water right was changed in Case No. W-3394. Of the 245 c.f.s. decreed to the Taos Valley Canal No. 3, 230 c.f.s. ("Middlemist Water") has been left undiverted by SLVIWO and accounted for as an offset to well depletions pursuant to that decree. The remaining 15 c.f.s. ("Zinn Water") was changed in Case No. W-3394 subject to a reservation by Pete E.

Subdistrict No. 6 ARP Approval: Plan Year 2022

and Mercedes Middlemist to divert and use up to that amount for irrigation pursuant to certain terms and conditions contained in that decree. The Zinn Water has continued to be used for irrigation up to and including the 2022 irrigation season.

In Case No. 2015CW3030, SLVIWO seeks to utilize the Middlemist Water and the Zinn Water for augmentation by leaving the water in the San Antonio River as decreed in Case No. W-3394, by diverting water at the Taos Valley Canal No. 3 and continuing to store water in Cove Lake Reservoir for subsequent release to the San Antonio River, by recharging the confined and unconfined aquifers via a groundwater recharge project, by delivering water to satisfy compact obligations, by substituting water delivered to satisfy the compact in exchange for depletions and water diverted at other structures during different times within a year and to divert and store the water in several reservoirs, either directly or via exchange, for later release to the San Antonio River, Conejos River and the Rio Grande for augmentation purposes. On January 25, 2019, SLVIWO filed an Unopposed Motion to Bifurcate Case No. 15CW3030. In that Motion, SLVIWO sought to bifurcate the claimed exchange to the Martinez Ditch and the Recharge Project from the other claims in the application.

SWSP 6074 has been approved for the Subdistrict's use in the 2022 ARP of the Taos Valley No 3 water that is the subject of the SLVIWO's court case. DWR conservatively estimates a potential yield of ± 270 acre-feet (54.32% of ± 500 acre-feet, in total) based on current conditions with streamflow being similar to the 2021 irrigation year. The Taos Valley No 3 yielded 383 acre-feet in 2021. SWSP 6074 has been approved for the Subdistrict's use in the 2022 ARP of the Taos Valley No 3 water that is the subject of the SLVIWO's court case. A copy of the approval is included as an Exhibit to this letter.

Colorado Parks & Wildlife Tabor Ditch No 2 Held in Rio Grande Reservoir (Section 2 of 11.1.4 of the ARP)

Colorado Parks & Wildlife agreed to exchange Tabor Ditch No 2 water currently stored in Rio Grande Reservoir, through Fish & Wildlife Service, into a Subdistrict pool in Rio Grande Reservoir to be used for the remedy of Subdistrict injurious depletions. The Subdistrict submitted SWSP 7265 on 4/8/2021 for use of this water in the 2021 ARP. A deficiency letter was sent 11/2/2021 requesting CPW provide records of the history of tracking of Tabor Transmountain Ditch water to confirm amounts and locations in storage. To date, this deficiency has not been satisfied. This documentation will be required for approval of the use of Tabor Transmountain Ditch water as a replacement source whether approval is sought under an SWSP or other mechanism.

Bureau of Land Management Treasure Pass Ditch Transmountain Water Rights Held in Beaver Reservoir (Section 3 of 11.1.4 of the ARP)

Subdistrict No. 6 ARP Approval: Plan Year 2022

For the 2022 Plan Year, BLM agreed to exchange Treasure Pass Diversion Ditch transmountain water, currently stored in Beaver Reservoir to the Subdistrict's pool in Beaver Reservoir to be used for the remedy of injurious depletions caused by ARP Wells.

Forbearance Agreements (Section 4 of 11.1.4 of the ARP)

Pursuant to section 37-92-501(4)(b)(I)(B), C.R.S., the Subdistrict has reached agreement with a multitude of ditches whereby they accept that, subject to the specific provisions of the forbearance agreement, injury to their water rights resulting from the use of groundwater by ARP Wells may be remedied by means other than providing water to replace stream depletions, when they are the calling right on the Conejos River system, Alamosa River, or Rio Grande. The majority of these contracts with individual ditches were made for three-year terms.

The projected acre-feet of forbearance was based on an analysis of the number of days each ditch was the calling right in years of similar hydrologic conditions as those predicted in 2022. The years used for the analysis for the Rio Grande were 2013, 2015, and 2020. The analysis for the Alamosa included 2016 and 2021. The average number of days each ditch was estimated to be the calling right was then multiplied by the average daily acre-feet of injurious stream depletions during the Plan Year, excluding months outside the irrigation season. The expected yields listed in Table 3.1 are intended to be a conservative estimate of their potential yield to show the Subdistrict's ability to remedy injurious stream depletions. The estimate for the Rio Grande Canal did not include days that "Special Water" priorities were the calling rights even though all or a portion of those rights are included in forbearance agreements with the Subdistrict for the Plan Year and may be utilized at the discretion of the Subdistrict.

To project the Conejos forbearance potential, the Subdistrict used call records from 2021. The justification for this comparison between 2021 and 2022 is the soil moisture conditions, streamflow conditions, and long-range temperature outlook are projected to be very similar. The Subdistrict has confidence this is a reasonable way to project the amount of forbearance the Subdistrict anticipates they could conservatively expect to use for the 2022 Plan Year. Documentation for the estimated yield analysis of the various forbearance contracts was provided by the Subdistrict as a supplement to the ARP.

It is noted that the majority of these agreements allow the Subdistrict to remedy injurious stream depletions under the agreement or by providing water at the Subdistrict's sole discretion. Four of the agreements do not allow this flexibility, the Alamo, Ball Bros 1 & 2, Los Sauces, and William Stewart, so are "mandatory" forbearance agreements.

The Subdistrict made an agreement with the Guadalupe and Brazos Del Norte Ditches to store in Platoro Reservoir the amount of depletion owed daily when the Ditches are the calling priority. The stored water is to be released later by the Conejos Water Conservancy District at the discretion of the Ditches, and must be released within the same calendar year as it was stored. Exercise of this agreement is at the sole discretion of the Subdistrict. As

Subdistrict No. 6 ARP Approval: Plan Year 2022

stated in the agreement, any releases of this water will be in compliance with the legal and physical restrictions on such releases.

Closed Basin Project Production (Section 5 of 11.1.4 of the ARP)

According to the information provided in the ARP, the projected production of the Closed Basin Project delivered to the Rio Grande is 8,500 acre-feet during calendar year 2022. The allocation of the Closed Basin Project production in accordance with agreements is 60% to the Rio Grande and 40% to the Conejos River basin over the long term with provision for adjustments in the allocation during individual years. The 2022 allocation of the Closed Basin Project production will be 60% to the Rio Grande and 40% to the Conejos River.

Per a letter from the Rio Grande Water Users Association dated April 7, 2022, the Board of Directors passed a motion to specifically allocate 3,800 acre-feet of the Rio Grande's share of the usable yield of the Closed Basin Project to replace the stream depletions under Subdistricts No. 1, No. 2, No. 3, No. 5 and No. 6. Similarly, the Board of Directors of the San Luis Valley Water Conservancy District agreed to the allocation as stated in their letter to the Rio Grande Water Conservation District on April 7, 2022.

The Conejos Water Conservancy District Board notified RGWCD by letter dated April 7, 2022 to specifically allocate the Conejos River's share of the usable yield of the Closed Basin Project to replace the injurious stream depletions for the 2022 ARP for Subdistrict No. 3 & Subdistrict 6.

A copy of each letter reporting the approval was provided in Appendix H of the ARP. The resolution from RGWCD allowing the Subdistrict to use Closed Basin Project water in the 2022 ARP was provided as supplemental information.

11.1.5 Documentation of Progress towards Achieving and Maintaining a Sustainable Water Supply

Water Levels, Pressure Levels, and/or Groundwater Withdrawals (Section 1 of 11.1.5 the ARP)

Rule 8.1.7 of the Groundwater Rules includes provisions for meeting the requirements for achieving and maintaining a Sustainable Water Supply in the confined aquifer. Per the State Engineer's approval letter for the PWM, dated September 25, 2019, the Alamosa La Jara Response Area five-year running average groundwater withdrawals were below the 1978-2000 average groundwater withdrawals for the Alamosa La Jara Response Area of 113,740 acre-feet.

Subdistrict metered groundwater withdrawals account for approximately 99 percent of the total metered groundwater withdrawals annually over the period 2011-2021 in the Alamosa La Jara Response Area. The current five-year running average groundwater withdrawals for

Subdistrict No. 6 ARP Approval: Plan Year 2022

ARP Wells for the period 2016-2020 is 93,963 acre-feet. The previous five-year running average for ARP wells was 90,220 acre-feet. The Subdistrict reports the five-year running average groundwater withdrawals for ARP wells increased in 2021 by 3,743 acre-feet, using DWR's groundwater meter records.

Based on the trends of both the Alamosa La Jara Response Area and the Subdistrict's five-year average, the Subdistrict will remain in compliance with the Sustainable Water Supply Requirement of the Rules.

Included in Appendix K is the State Engineer's memo dated July 1, 2021, regarding the Composite Water Head for Confined Aquifer Response Area in Division 3: July 2021 Requirement of Division 3 Groundwater Rules Section 8.1.4. The Composite Water Head for 2021 was 0.05 feet, lower than any year of record since 2015, the base year.

Listing of Irrigated Acres Proposed to be Temporarily or Permanently Fallowed and Associated Water Rights (Section 2 of 11.1.5 the ARP)

The Subdistrict is not currently pursuing fallowing of any irrigated lands within the boundaries of the Subdistrict.

Listing of Water Rights Proposed to be Temporarily or Permanently Retired and Historical Operations of Each Water Right (Section 3 of 11.1.5 the ARP)

No listing of retired water rights was submitted with this ARP.

Other Proposed Actions to be Taken as Applicable (Section 4 of 11.1.5 the ARP)

No listing of other proposed actions was submitted with this ARP

Findings:

Based on the information provided in the ARP and discussed above, I make the following findings:

1. The projected groundwater withdrawals are based upon the inventoried Subdistrict Wells, their historical pumping, and projected stream flows. The inventory of wells is consistent with the information in DWR's databases. The historical pumping associated with the Wells is based on diversion records on file with the DWR. The method implemented by the Subdistrict to project groundwater withdrawals for the ARP Wells for 2022 is consistent with historical pumping information and streamflow forecast from the Division Engineer's projection and the NRCS Forecast.
2. Overall, the Subdistrict inputs to the Response Functions produced a calculation of depletions that DWR considers conservative such that the depletions are covered and no injury will occur.

Subdistrict No. 6 ARP Approval: Plan Year 2022

3. Projected stream depletions are calculated based on Response Functions generated from RGDSS Groundwater Model runs. The Response Functions are based on the RGDSS Model version 6P98, which was approved by the PRT. The Subdistrict used the 6P98 Response Functions in determining stream depletions. The ARP Year depletion schedule is included as an Exhibit to this letter.
4. The comparison of CBP projected deliveries with all Subdistricts operating under 2022 ARPs indicates the CBP production, at least on an annual basis, is adequate to cover the Non-Irrigation season depletions for all the Subdistricts.
5. The ARP identifies the sources, availability, and amounts of replacement water and remedies that the Subdistrict will use to remedy Injurious Stream Depletions during the coming year and demonstrates the sufficiency of such water to remedy such Injurious Stream Depletions:

Conejos River

The Subdistrict depletions for the Conejos River system for this ARP are 2,770 acre-feet during the irrigation season and 1,408 acre-feet during the non-irrigation season for a total of 4,177 acre-feet.

- Irrigation Season: The Subdistrict has ± 462 acre-feet in storage in Platoro Reservoir, expects to yield ± 300 acre-feet from BLM excess augmentation water “in season”, and the Taos Valley No. 3 is estimated to yield ± 270 acre-feet for a total of $\pm 1,030$ acre-feet. The Subdistrict indicates a yield of $\pm 2,200$ acre-feet from forbearance agreements during the irrigation season and in April 2023, totaling $\pm 3,230$ acre-feet.

The submitted portfolio of water from storage and adjusted in-season yield in the 2022 ARP Year indicates there would be a deficit of $\pm 1,740$ acre-feet of firm water to cover Injurious Stream Depletions in the unlikely event that no forbearance is available. My staff reviewed the historical calls on the Conejos for the ditches expected to generate estimated forbearance during the ARP Year as summarized below. The portfolio of water from storage and potentially $\pm 2,075$ acre-feet from DWR forbearance analysis totals $\pm 3,110$ acre-feet and indicates sufficient water to cover Injurious Stream Depletions for the Plan Year.

DWR Analysis of Forbearance Yield

- DWR staff prepared an analysis using the current stream flow numbers and forecast flows for the irrigation season, which is projected to end on November 1st, 2022. The focus of the analysis was to determine which ditches might be the calling priorities throughout this period. A similar analysis was completed for the irrigation month of April 2023, using average conditions because a reliable 2023 winter forecast is not yet available. The Subdistrict has secured forbearance contracts with numerous ditches ranging from the No. 1 priorities through very junior water rights.

Subdistrict No. 6 ARP Approval: Plan Year 2022

- These agreements for ditches that are likely to be the calling rights on the Conejos for the 2022 irrigation season and April of 2023 could possibly account for $\pm 2,075$ acre feet. This amounts to 75%, of the 2,770 acre-feet of depletions owed.
- Non-Irrigation Season: The Subdistrict has $\pm 1,410$ acre-feet of Closed Basin Project water available to pay non-irrigation season depletions.

Alamosa River

The Subdistrict depletions on the Alamosa are 505 acre-feet during the irrigation season and 6 acre-feet during the non-irrigation season for a total of 511 acre-feet.

- Irrigation Season: The Subdistrict has ± 60 acre-feet in storage in Terrace Reservoir and indicates a yield of ± 470 acre-feet from forbearance agreements during the 2022 irrigation season and in April 2023, totaling ± 530 acre-feet.

The submitted portfolio of water from storage in the 2022 ARP Year indicates there would be a deficit of 450 acre-feet of firm water to cover Injurious Stream Depletions in the unlikely event that no forbearance is available. My staff reviewed the historical calls on the Alamosa for the ditches expected to generate estimated forbearance during the ARP Year as summarized below. The portfolio of water from storage and potentially ± 450 acre-feet from DWR forbearance analysis totals ± 510 acre-feet and indicates sufficient water to cover Injurious Stream Depletions for the Plan Year.

DWR Analysis of Forbearance Yield

- DWR staff prepared an analysis using the current stream flow numbers and forecasted flows for the irrigation season, which presumptively ends on November 1st, 2022. The focus of the analysis was to determine which ditches might be the calling priorities throughout this period. A similar analysis was completed for the irrigation month of April 2023, using average conditions because a reliable 2023 winter forecast is not yet available. The Subdistrict has secured forbearance contracts with numerous ditches ranging from the No. 1 priorities through very junior rights on the Alamosa River.
- These agreements for ditches that are likely to be the calling rights on the Alamosa for the 2022 irrigation season and April of 2023 could possibly account for 450 acre feet of the depletions owed. This amounts to 90%, of the 505 acre-feet of depletions owed.
- Non-Irrigation Season: The Subdistrict is not obligated to pay depletions on the Alamosa during the non-irrigation season at this time.

Rio Grande

The Subdistrict depletions on the Rio Grande are 1,771 acre-feet during the irrigation season and 1,737 acre-feet during the non-irrigation season for a total of 3,508 acre-feet.

Subdistrict No. 6 ARP Approval: Plan Year 2022

- Irrigation Season: The Subdistrict has $\pm 1,460$ acre-feet in storage in Beaver, Rio Grande, Continental and Santa Maria Reservoirs and indicates a yield of $\pm 1,050$ acre-feet from forbearance agreements during the 2022 irrigation season and in April 2023, totaling $\pm 2,510$ acre-feet.

The submitted portfolio of water from storage in the 2022 ARP Year indicates there would be a deficit of ± 310 acre-feet of firm water to cover Injurious Stream Depletions in the unlikely event that no forbearance is available. My staff reviewed the historical calls on the Rio Grande for the ditches expected to generate estimated forbearance during the ARP Year as summarized below. The portfolio of water from storage and potentially $\pm 1,000$ acre-feet from DWR forbearance analysis totals $\pm 2,460$ acre-feet and indicates sufficient water to cover Injurious Stream Depletions for the Plan Year.

DWR Analysis of Forbearance Yield

- DWR staff prepared an analysis using the current stream flow numbers and forecasted flows for the irrigation season, which presumptively ends on November 1st, 2022. The focus of the analysis was to determine which ditches might be the calling priorities throughout this period. A similar analysis was completed for the irrigation month of April 2023, using average conditions because a reliable 2023 winter forecast is not yet available. The Subdistrict has secured forbearance contracts with numerous ditches ranging from very senior priorities through very junior rights on the Rio Grande.
 - These agreements for ditches that are likely to be the calling rights on the Rio Grande for the 2022 irrigation season could possibly account for $\pm 1,000$ acre feet of the depletions owed. This amounts to 56%, of the $\pm 1,770$ acre-feet of depletions owed.
- Non-irrigation Season: The Subdistrict has $\pm 1,740$ acre-feet of Closed Basin Project water allocated to pay non-irrigation season depletions.
6. Section 4.1.5 of the Subdistrict's PWM includes the provision, "the Subdistrict may continue to assess fees until all Post-Plan Injurious Stream Depletions caused by past groundwater withdrawals from Subdistrict Wells have been remedied." This allows the Subdistrict to provide a financial guarantee to assure that all Post-Plan Injurious Stream Depletions will be replaced or otherwise remedied if the Subdistrict were to fail or otherwise not be allowed to continue groundwater withdrawals.
 7. Upon approval of the Subdistrict's PWM, it was concluded the Subdistrict is already operating within the 5-year 1978-2000 average as amended by the CAS stipulation. In all future years the five year running average of metered total withdrawals must not exceed the average annual withdrawals for the period of 1978 through 2000. The Subdistrict is in compliance with this metric.

The Subdistrict has presented sufficient evidence and engineering analysis to predict where and when Injurious Stream Depletions will occur and how they will replace those Injurious

Subdistrict No. 6 ARP Approval: Plan Year 2022

Stream Depletions to avoid injury to senior surface water rights under the following Terms and Conditions.

This ARP is hereby approved pursuant to the following Terms and Conditions:

1. This ARP shall be valid for the period of **May 1, 2022 through April 30, 2023**, unless otherwise revoked, modified, or superseded by me, a decree, or order of the court.
2. The Subdistrict must replace or remedy the Injurious Stream Depletions resulting from Subdistrict ARP Well groundwater withdrawals.
3. Contract wells will be covered to the extent of their permitted/decreed uses.
4. Deliveries (including transit losses) of stored water made available for the replacement of Injurious Stream Depletions shall be determined by the Division Engineer pursuant to this ARP and associated decrees.
5. If the limit is reached for any particular forbearance agreement, then the Subdistrict will need to remedy Injurious Stream Depletions to that particular ditch or canal with another remedy. Storage under the forbearance agreement with the Guadalupe and Brazos Del Norte Ditches is only allowed upon prior approval of the Division Engineer.
6. The Division Engineer shall determine on an ongoing basis whether he can administer the operations under each forbearance agreement. If the Division Engineer cannot, then that operation shall cease. General Forbearance Protocols for the San Luis Valley River Systems for 2022 were prepared by the Division Engineer. A copy of the protocols is included with this letter.
7. The Subdistrict shall provide daily replacement water accounting (including, but not limited to diversions, depletions, replacement sources, and river calls) on a monthly basis. The accounting must be emailed to the Division Engineer (Craig.Cotten@state.co.us), the Water Commissioners (sam.riggenbach@state.co.us), rachel.rilling@state.co.us, tom.stewart@state.co.us, aaron.holman@state.co.us, travis.robinson@state.co.us and the Subdistrict Coordinator (deborah.sarason@state.co.us), within 10 days after the end of the month for which the accounting applies. Accounting and reporting procedures are subject to approval and modification by the Division Engineer.
8. The Subdistrict must adhere to the terms and conditions of the SWSP(s) incorporated as part of the ARP. The use and inclusion of any new replacement water within the ARP is subject to SWSP approval or approved by the Water Division No. 3 Water Court for a change of water right. Prior to the use of any new replacement water, the State Engineer will evaluate for use as an amendment under this ARP.
9. Regarding the Subdistrict's request to aggregate depletions owed between stream reaches, much of the negative depletion amounts that the Response Function output

Subdistrict No. 6 ARP Approval: Plan Year 2022

generated on Stream Reach 3 of the Rio Grande reflect the point-source return flow attributed to the City of Alamosa in the RGDSS Model. This negative depletion represented affects the Rio Grande depletions when all three reaches are live to the State line. Should the Rio Grande stream reaches become disconnected hydraulically during the ARP Year, the Division Engineer shall determine if aggregation of these negative depletion amounts for purposes of determining depletions owed on Stream Reaches 1 and 2 of the Rio Grande is appropriate during those periods.

10. Regarding the Subdistrict's request to aggregate depletions with other subdistricts, the Subdistrict may make requests for these types of changes formally to the Division Engineer, providing details of the request and documentation supporting the need to make a change to the approved ARP depletion schedule. The Division Engineer will consider such a request when it is made, under the protocol of DWR and in light of the conditions on the particular stream at the time and, if deemed appropriate, approve the request. The Subdistrict will not adopt any change until after approval by the Division Engineer.
11. In the event the CBP deliveries during the non-irrigation season months are not enough to remedy the total of the RGWCD Subdistricts non-irrigation season depletions, it is acceptable for the CBP deliveries during the irrigation season months be used to remedy the additional amount of non-irrigation season depletions. However, CBP deliveries may only be credited against non-irrigation season depletions that occur during the same calendar year and during the same ARP Year. In general, January through April CBP deliveries may be used to remedy January through March of the ARP Year depletions and May through December CBP deliveries may be used to remedy November and December ARP Year depletions.
12. The Subdistrict is relying heavily upon forbearance agreements to meet the requirements for mitigation of injurious stream depletions. The Subdistrict is strongly encouraged to actively pursue permanent replacement sources to cover depletions in the event that the forbearance agreements are not sufficient. In the unlikely event that the various SWSPs submitted in March and April 2021 are not approved or if the forbearance agreements do not yield the amounts needed to cover depletions as expected during the 2021 ARP Year, the Subdistrict will invoke its "After Acquired Sources of Remedy" clause in the ARP and will acquire sufficient additional sources to satisfy the depletion schedule approved under this ARP. If the Subdistrict is unable to acquire sufficient additional sources, the Subdistrict will not be able to continue operation under this ARP.
13. All deliveries of replacement water shall be measured in a manner acceptable to the Division Engineer. The Subdistrict shall install and maintain measuring devices as required by the Division Engineer for operation of this approved ARP.
14. The Subdistrict must submit an Annual Review of its ARP pursuant to Rule 12.

Subdistrict No. 6 ARP Approval: Plan Year 2022

15. The Subdistrict must replace or remedy all Injurious Stream Depletions caused by non-augmented pumping associated with Subdistrict ARP Wells.
16. The Subdistrict must comply with the Rules, the Subdistrict PWM, and this ARP.

Approval of this ARP does not authorize any change, increase, or expanded use of any water right or permit. Any change, increase, or expansion of a water right or permit will need to comply with existing decrees and or permits, the Confined Aquifer New Use Rules, the Measurement Rules, the Rio Grande Basin Groundwater Use Rules, and may require approval of the Water Court.

The approval of this ARP is made with the understanding that if the ARP proves insufficient to remedy Injurious Stream Depletions, the State Engineer has the authority to invoke the retained jurisdiction of the Division No. 3 Water Court.

I want to thank you for your cooperation and compliance with this approved ARP and for your continued cooperation and compliance in the future. Your efforts are greatly appreciated. If you have any questions do not hesitate to contact any of my staff in Denver or Alamosa.

Sincerely,

Kevin G. Rein, P.E.
State Engineer
Director of the Division of Water Resources

**Re: Special Improvement District No. 3 (“Subdistrict No. 3”) and Special Improvement District No. 6 (“Subdistrict No. 6”) of the Rio Grande Water Conservation District Substitute Water Supply Plan
SLVIWO Taos Valley No. 3 Water Rights
Water Division 3, Water Districts 22 and 24
Case No. 15CW3030A, SWSP ID 6074**

Approval Period: April 1, 2022 to December 31, 2022

Contact phone number for Mr. Peter J. Ampe: 303-296-8100; peterampe@hillrobbins.com

Dear Mr. Ampe:

We have reviewed your letter dated February 14, 2022 in which you request approval of a substitute water supply plan (“SWSP”) on behalf of the Special Improvement District Nos. 3 and 6 (“Subdistrict No. 3 and 6” or “Applicants”) of the Rio Grande Water Conservation District pursuant to § 37-92-308(4), C.R.S. Notice was provided to all parties who have subscribed to the Division 3 SWSP Notification List and also to the opposers in Case No. 15CW3030 on February 14, 2022. On March 11, 2019, the court application was bifurcated into Case Nos. 15CW3030A and 15CW3030B. No comments were received during the statutory 35-day comment period. The required \$300 filing fee (receipt number 10018967) has been received.

SUBDISTRICT OPERATION

Subdistrict Nos. 3 and 6 were established by order of the court in Case Nos. 2016CV30021 and 2018CV30014. Members of these Subdistricts are landowners within the Rio Grande Water Conservation District (“RGWCD”) who rely on groundwater for all or part of their commercial, municipal, industrial and/or irrigated agricultural practices within the area defined by the Rio Grande Decision Support System Groundwater Model and the Rules Governing the Withdrawal of Groundwater in Water Division No. 3, District Court, Water Division No. 3, Case No. 15CW3024, as the Conejos and Alamosa La Jara Response Areas. The principal goals of the Subdistricts are to protect senior surface water rights, to support a Sustainable Water Supply in the Confined Aquifer underlying the Subdistricts’ boundaries and to avoid unreasonable interference with the state’s ability to fulfill its obligations under the Rio Grande Compact.

This SWSP is being sought in order to meet the requirements of the Plans of Water Management (“Plans”) as approved by the State Engineer in Case No. 2018CW3013 and 2019CW3011. The overall objective of the Plans is to provide a water management alternative to individual plans for augmentation or state-imposed regulations that limit the use of wells within Subdistrict Nos. 3 and 6; that is a system of self-regulation using economic-based incentives that promote responsible groundwater use and management and ensures protection of senior surface water rights. As part of the Plans, Subdistrict Nos. 3 and 6 must each submit an Annual Replacement Plan (“ARP”) for the State Engineer’s review and approval, showing the portfolio of water rights and other actions that Subdistrict Nos. 3 and 6 will take to replace injurious depletions to senior water rights caused by groundwater withdrawal by Subdistrict Wells during the Plan year. This SWSP application is intended to provide a part of the water supplies to be used in the Subdistricts’ ARPs.

SWSP OPERATION

The San Luis Valley Irrigation Well Owners, Inc. (“SLVIWO”) has filed a case in water court for a recharge project and rights of substitution and exchange. The water right that is the subject of the case is the Taos Valley Canal No. 3, which was originally decreed in the District Court of Conejos County on October 3, 1890. In 1975, the SLVIWO filed an application for a plan for augmentation including exchange and to change the place and type of use of the Taos Valley No. 3 water right to augment depletions caused by well users of the SLVIWO, in Case No. W-3394. 245 cfs were decreed to the Taos Valley No. 3, of which 230 cfs have been left undiverted and accounted for as an offset to well depletions pursuant to that decree. This water is referred to as the “Middlemist” water. The remaining 15 cfs were reserved for irrigation and are referred to as the “Zinn” water. The amount of water available for diversion in any particular year under the Zinn water right is determined by the ten-year moving average of the water available at the Taos Valley No. 3 Headgate, as described in Case No. W-3394.

This SWSP request has been submitted for a change of water rights for the Middlemist and Zinn water in compliance with the pending court case to allow augmentation, exchange, storage by exchange in Platoro, Rio Grande, Continental, and Trujillo Meadows Reservoirs, delivery of water to satisfy compact obligations, and substitution of water delivered to satisfy the Compact in exchange for depletions and water diverted at other structures during different times during the term of this SWSP. Storage to any structure other than Cove Lake Reservoir will only occur under the terms of a separate agreement with the reservoir owner. Prior to storing water in another structure, the Applicant must provide a copy of a storage agreement with the reservoir owner to the Division Engineer and Water Commissioner.

When the Taos Valley Canal No. 3 is in priority during the 2022 irrigation season, it will be administered under the conditions of this SWSP (ID #6074) and in conjunction with the conditions of SWSP ID #7267 issued to Trinchera Subdistrict and in conjunction with the conditions of SWSP ID #6093 issued to SLVIWO. Water will be delivered to the Compact only under the conditions of SWSP ID #6074 and SWSP ID #7267.

A single lease agreement between SLVIWO and Subdistricts No. 3, No. 6 and Trinchera was provided pursuant to these SWSPs. The lease agreement is for a single term only and is not renewable. Further, it only applies to water produced under the 2015CW3030 case during the

2022 Irrigation Season. The lease limits the amount of Taos Valley Canal No. 3 water available for credit up to 2,000 acre-feet for Subdistrict No. 3, up to 3,000 acre-feet for Subdistrict No. 6, and up to 3,000 acre-feet for Trinchera Subdistrict. These limits, totalling 8,000 acre-feet, apply to water that is available for exchange to storage or available for delivery to a Compact 'Depletion Bank'. Delivery losses are assessed against all water generated.

Any water available for exchange to reservoir storage will be administered under SWSP ID #6093.

CONDITIONS OF APPROVAL

This SWSP is hereby approved pursuant to C.R.S. § 37-92-308(4), subject to the conditions stated below:

1. This SWSP shall be valid for the period of April 1, 2022 through December 31, 2022 unless otherwise revoked or superseded by decree. The initial date of approval for this SWSP was April 29, 2019 (with a start date of May 1, 2019). Pursuant to § 37-92-308(4)(b), C.R.S., "if an applicant requests a renewal of a plan that would extend the plan past three years from the initial date of approval, the applicant shall demonstrate to the state engineer that the delay in obtaining a water court decree is justifiable and that not being able to continue operating under a substitute water supply plan, until a decree is entered, will cause undue hardship to the applicant." This information must be submitted with any SWSP request that seeks a plan approval period that would extend beyond December 31, 2022. Additional SWSPs are required until a court-decreed plan for augmentation is obtained for the proposed uses. Should an additional SWSP be requested, the provisions of § 37-92-308(4)(b), C.R.S., shall apply. The statutory fee of \$300 will be required pursuant to § 37-92-308(8), C.R.S. Any request for an additional SWSP must be submitted to this office no later than **January 1, 2023. This is the fourth year of operation of this SWSP.**
2. Approval of this SWSP is for the purposes stated herein. Additional diversion structures and/or additional uses for the water that is the subject of this SWSP will be allowed only if a new SWSP is approved for those additional structures/uses. The replacement water, which is the subject of this SWSP, cannot be sold or leased to any other entity during the term of this SWSP without prior approval of the Division Engineer.
3. Storage of the subject water in any structure other than Cove Lake Reservoir may only occur under the terms of a separate agreement with the reservoir owner. Prior to storing water in another structure, the Applicant must provide a copy of a storage agreement with the reservoir owner to the Division Engineer and Water Commissioner.
4. The Applicant shall provide daily accounting (including, but not limited to diversions, depletions, replacement sources, and river calls) on a monthly basis. The accounting must be emailed to Deborah.Sarason@state.co.us, David.Hofmann@state.co.us and the Water Commissioners Tom.Stewart@state.co.us, Aaron.Holman@state.co.us, Travis.Robinson@state.co.us and Sam.Riggenbach@state.co.us), within 10 days after the end of the month for which the accounting applies. Accounting and reporting

procedures are subject to approval and modification by the Division Engineer. Frequent, if not daily, contact with the water commissioner is required to ensure daily administration and to prevent injury to other parties.

5. When the Taos Valley Canal No. 3 water right is in priority, and it is not entirely available for exchange into reservoir storage, water will be delivered from the Taos Valley No. 3 Canal heading to the Rio Grande Compact gages near La Sauses, minus delivery losses. Accordingly, 30.61% of the flow will be attributed to Subdistrict No. 3, 54.32% of the flow will be attributed to Subdistrict No. 6, and 15.06% will be attributed to Trinchera Subdistrict. If a Subdistrict chooses to cease delivery of this SWSP water, then the flow will be allocated to the remaining Subdistricts in proportion to the percentages set forth by the lease agreement.
6. The applicant will be charged a 7.5% delivery loss from the Taos Valley No. 3 heading to the Compact gages or an amount set by the Division Engineer based on river conditions. This loss is the same as charged by agreement with the Division Engineer staff and was conveyed to the Subdistrict No. 3, Subdistrict No. 6 and Trinchera Subdistrict staff and the Applicant's engineer. Transit loss is subject to assessment and modification as determined by the Division Engineer.
7. The Taos Valley Canal No. 3 replacement water will be delivered directly to the middle of Conejos Stream Reach 2 (RGDSS) and/or to Rio Grande Stream Reach 3 when these streams are connected. These credits may be used on the day the credits are generated for replacement of daily injurious stream depletions in Rio Grande Stream Reach 3 and/or Conejos Stream Reach 2; and/or replacement of daily injurious stream depletions by exchange to other stream reaches defined in the RGDSS; and/or by exchange to a reservoir.
8. Each Subdistrict may accrue water credits delivered to the Compact Depletion Bank only up to a limit that is reasonable as determined by the Division Engineer for use as a source of replacement of injurious depletions as projected through their respective 2022 ARPs. Use of these credits cannot cross Compact or ARP Years. They must be used to offset depletions during the Compact (Calendar) Year in which they are generated, and credits generated in one ARP Year may only be used to offset depletions from the same ARP Year (ending April 30). Depletion Bank credits accrued in Rio Grande Stream Reach 3 can be used for remedy of depletions owed to Rio Grande Stream Reach 3 during the irrigation and non-irrigation seasons, but can only be used during the non-irrigation season to remedy depletions for other stream reaches defined in the RGDSS. The total amount of water approved for delivery to the Depletion Bank under the conditions of this SWSP will not exceed 8,000 acre-feet, (reflecting $\pm 8,649$ acre-feet at the Taos Valley Canal No. 3 headgate).
9. Each Subdistrict must notify the Water Commissioner when their desired total of water delivered to the Depletion Bank is reached. Upon notification by one Subdistrict, additional available water delivered to the Depletion Bank will accrue to the remaining Subdistricts until their desired total is reached. Once the lesser of the sum of these totals or 8,000 acre-feet has been delivered to the La Sauses gages, no additional water will accrue to the Depletion Bank under this SWSP. At the end of the

day on December 31, 2022, all water left in the Depletion Bank will revert back to the native system and will not be available for any further use under this SWSP or for future depletion replacements.

10. In the situation when the Taos Valley Canal No. 3 water right is in priority, and it is available for exchange, and the limits stated in the prior Condition have not been reached, SLVIWO and the Subdistricts will notify the Water Commissioner whether water will be delivered to the Depletion Bank or to a reservoir. The prior Condition will be administered until notification is received, after which, the Water Commissioner will adjust deliveries accordingly.
11. If any term or condition of this SWSP conflicts with any of the terms and conditions of the Plan, the terms and conditions of the Plan shall control.
12. Prior to the operation of any exchange, the Applicant is required to notify the Water Commissioner and obtain the Water Commissioner's approval for the operation of the exchange at least 48 hours prior to operation, or less if allowed by the Water Commissioner. The Applicant is required to obtain the Water Commissioner's approval on a daily basis or other interval as required by the Water Commissioner. The proposed exchanges are limited to operating only at times there is a continuous live stream between the exchange from and exchange to points and at times sufficient exchange potential exists to operate the exchange without injury to other water users.
13. The name, address, and phone number of the contact person who will be responsible for the operation and accounting of this SWSP must be provided with the accounting forms to the Division Engineer and Water Commissioner.
14. All deliveries for augmentation, exchange, or storage shall be measured in a manner acceptable to the Division Engineer. The Applicant shall install and maintain measuring devices as required by the Division Engineer for operation of this SWSP.
15. Release of stored water made available for the replacement of injurious depletions shall be at the discretion of the Water Commissioners or the Division Engineer.
16. The State Engineer may revoke this SWSP or add additional restrictions to its operation if at any time the State Engineer determines that injury to other vested water rights or to the Compact has occurred or will occur as a result of the operation of this SWSP. Should this SWSP expire without renewal or be revoked prior to adjudication of a permanent plan for augmentation, all use of water under this SWSP must cease immediately.
17. The decision of the State Engineer shall have no precedential or evidentiary force, shall not create any presumptions, shift the burden of proof, or serve as a defense in any pending water court case or any other legal action that may be initiated concerning the SWSP. This decision shall not bind the State Engineer to act in a similar manner in any other applications involving other SWSPs or in any proposed renewal of this SWSP, and shall not imply concurrence with any findings of fact or conclusions of

law contained herein, or with the engineering methodologies used by the Applicant. Any appeal of a decision made by the State Engineer concerning an SWSP pursuant to § 37-92-308(4), C.R.S., shall be to the Division 3 Water Judge within thirty days of the date of this decision and shall be consolidated with the pending court case, 15CW3030A.

Should you have any questions, please contact Melissa van der Poel of this office or Craig Cotten, Division Engineer, in the Division 3 office in Alamosa at (719) 589-6683.

Sincerely,

Jeff Deatherage, P.E.

Notes for columns:

Exhibit C

General Forbearance Protocols For San Luis Valley River Systems

Subdistricts No. 1, No. 2 (Rio Grande Alluvium), No. 3 (Conejos), No. 4 (San Luis Creek), No. 6 (Alamosa La Jara) and Trinchera Subdistrict will be operating under ARPs and will replace depletions to their affected streams on May 1st, the beginning of the 2022 ARP year. Subdistrict No. 5 (Saguache) will also be subject to these protocols when an ARP is approved. Along with the replacement of stream depletions, the State and Division Engineer may allow the owners of the calling ditch to ‘forbear’, or choose to not take the water that otherwise would have been allocated to that ditch in exchange for receiving payment in some other form. This forbearance is authorized under Colorado Revised Statute 37-92-501 (4)(b)(1)(B) which states that the State Engineer shall “Recognize contractual arrangements among water users, water user associations, water conservancy districts, ground water management subdistricts, and the Rio Grande Water Conservation District, pursuant to which... injury to senior surface water rights resulting from the use of underground water is remedied by means other than providing water to replace stream depletions.”

In order to assist the Subdistricts, water users, and Water Commissioners in determining whether a forbearance contract will be allowed, the following are general guidelines regarding those forbearance contracts for the 2022 ARP year:

- A water right must be the calling water right in order to forbear. In other words, the ditch must be legally and physically entitled and able to receive and divert the replacement water that would have been placed into the river or stream reach if that ditch owner would have decided to take the water available instead of forbearing.
- The owner of a ditch that cannot physically divert all of the water under its priorities due to an inadequate ditch size or other physical restrictions cannot forbear for the amount that the ditch is not able to divert. However, this ditch may be able to forbear in the amount that it is physically and legally able to divert.
- The owner of a ditch that physically is not able to divert the replacement water entitled to it at certain times of the year (for instance during low flow periods), due to an inadequate diversion dam or headgate, or other reasons, cannot forbear during that time of year unless and until the ditch or associated structures are repaired and physically able to take water.
- If it is certain that the owner(s) of a ditch would have declined to take water in their ditch on a given day that they were in priority to take water, for instance, if that owner cannot take their full priority due to a break in the ditch bank, or if the owner has not called for that water right in the ditch, etc., the ditch owner cannot forbear for that water right on that day.
- Forbearance will be allowed on water rights that are not large enough to cover the entire daily replacement amount. A ditch may be forbearing only a portion of the total daily replacement amount due to the size of the water right. In such cases, there may be several water rights in

various ditches that are forbearing at the same time in order to meet the entire replacement obligation of the Subdistrict.

- A ditch may operate under a partial forbearance contract with the understanding that the ditch company, Subdistrict or other appropriate party will manage the partial flow and partial forbearance at the heading and down ditch to the satisfaction of all water rights owner in that ditch that are in priority on that day. The manager of the ditch with partial forbearance must inform the Water Commissioner, prior to any operations, the manner and the capability in order to be in compliance, otherwise forbearance will not be allowed.
- Ditches with a forbearance contract must have accurate, reliable and operational measurement devices on the ditch.
- On a day when water could be placed into the river system for replacement of injurious depletions, and a section(s) of the stream is dry such that this replacement water would not have made it to the calling priority ditch, forbearance by that ditch(es) will not be allowed. During times of dry stretch(es) on the river system, each live stretch will be treated as its own calling system. Only the stretch(es) that includes an RGDSS modelled stream reach will have the ditch(es) eligible for forbearance. If water delivery could not make it physically to any structure in a particular RGDSS reach, then no forbearance is allowed and a water delivery will be required. The determination of the physical properties controlling these situations shall be at the sole discretion of the Water Commissioner and/or Division Engineer.
- A forbearance that results in a section of the river drying up, cannot be used to create a futile call. The river must be administered to replicate what conditions would have taken place had a continuous deliverance of water occurred.
